

CogniSoft Image Trainer

Introduction

The CogniSoft Image Trainer is a training utility that augments the V1KU module for accelerating the creation of knowledgebases based on 2-d image data based on the CogniMem technology. This utility allows you to create, validate, and modify training data for accuracy and thoroughness. Capture training data once, and use the training session data to optimize recognition accuracy with the built-in training activity monitor. Remove inaccurate training data and replay the training steps to validate your changes.
